

The Conclusion Of Many days Labor

I have just read, about a scientific research in which neither time or effort were spared. The idea really dates back to the new testament; something is said their about us having the hairs of our head's numbered. I clearly recollect reading the passage for it puzzled me as a child to decide why anybody should want to have there hairs numbered. Evidently that want has been felt now, and someone has took time to satisfy it. Furthermore he must of found a lot of good money just laying about waiting, for anyone who was eager to try foolish ways to spend coin of the realm. Who's money it was is a mystery to me, their was nothing in the article about it's owner. At any rate, enough money was found to hire people, to count every hair, on a number of person's heads. It was demonstrated that a Blonde is different from a Brunette in both quantity and quality of hair, I own that it don't surprise me to learn this, for I suspected it. Ill admit, that I don't see any way of using the knowledge, but isn't Nature and Science wonderful.

Ones leisure time in Spring

When the temperature not the Calendar shows that its really spring I prefer above everything else to take a walk. Perhaps most people do not share my enthusiasm. Well if they let me have my pleasure, I'll let them have their's. Give me decent pleasant weather and a free saturday afternoon, and I can guarantee myself a good time, my spirits rise gaily with the thermometer. It makes no difference where I go any place has entertainment for me. I seem to be one of those fortunate people, who recognizes that its a privilege to see the commonplace beauties which surround us. Why don't everyone see them? Hasn't it occurred to those who find there only enjoyment in movies or in other, mechanical, means of amusement that such delights shrink up to nothing in comparison with them finding the first wild flowers. It is much to be regretted, that High-School pupils find so much delight indoors and so little outside, there is even a few teachers of Botany who look on flowers simply as things to be analyzed, and wouldnt spend ten minutes' watching them grow.
