

tremendously complex combination of chemicals happening to get together. I don't think that anybody can quite, in his heart of hearts, really believe that things happened that way, and yet, it is so widely spread that many talk as if that is what they believe. The evolutionary theory talks a great deal about how life all life has developed from the very simple, one-celled organism, and then just by natural processes there has developed all this tremendous complexity, well Well, they are studying those little one-celled organisms now, much more than they have ever been studied before, and within the last 20 years it has been discovered that the amoeba and one-celled animals, even simpler than the amoeba, have within them, within that one cell, 100 different enzymes working together as a system, to synthesize the various chemical elements in order to produce very complex compounds that life requires. If this simple amoeba, 'so-called' came into existence purely by accident, requires a stretch of imagination, a stretch of faith, if you will, far beyond required to take the Word of the Living God for the explanation for how the universe has come into existence. Well, we find this man now, who is evidently not questioning the existence of God, the not questioning his omniscience and His omnipresence but who, up to this point, is oppressed by the thought that God is all around, we can't do anything but what God know about it. "Thou hast beset me behind and before, and laid thine hand upon me. Such knowledge is too wonderful for me; it is high, I cannot attain unto it. Whither shall I go from thy spirit? or whither shall I flee from thy presence? If I ascend up into heaven, thou art there: if I make my bed in hell, behold, thou art there. A few years ago was a guest at Cornell University. I was speaking to a student group there
