Then follows a large dark triangle of very high proximity and uniform and uninterrupted density. By tracing its composition as to subcategories in Col. 2 we immediately recognize that it derives exclusively from category *N* and that, as far as Documents are concerned, *J* and *E* alternate at random as if they never existed. Only one lonely *NP*-sample intrudes the conglomerate of *NJ* and *NE*: no. 5. When looked up in the list of 'Sample Limits', no. 5 is seen to be roughly identical with ch. 14, the one chapter which commentators were at a loss to attribute to any Document and which they designated in consequence to be a foreign body – either very ancient or a very late accretion to Genesis. The analysis demonstrates that it is actually fully consonant with *J = E*. Incidentally, Col. 3 is also quite enlightening: not one of the 26 samples in the present triangle comes from Division *I*, the dissimilarity of which from Divisions *II* and *III* was already brought to light by Discriminant Analysis.
